ENERGY EFFICIENCY INDICATORS
JUNE 2020 EDITION

DATABASE DOCUMENTATION
This document provides information regarding the June 2020 edition of the *Energy efficiency indicators* database. It can be found at the following link: [http://data.iea.org/](http://data.iea.org/). The database is updated twice a year in June and December.

The IEA also releases a short version of this database (free) with a selection data included in the extended one. The short version contains total final energy consumption by end use (i.e. not the split by energy product), comprehends fewer end uses, and presents data for selected years, with the indicators indexed to the year 2000. It can also be downloaded at the IEA data services.

Please address your inquiries to EnergyIndicators@iea.org.

*Please note that all IEA data are subject to the following Terms and Conditions found on the IEA’s website:* [https://www.iea.org/t_c/termsandconditions/](https://www.iea.org/t_c/termsandconditions/)

1. CHANGES FROM LAST EDITION

In order to meet increasing user’s needs with more timely data, since last year, the IEA energy efficiency indicators database is released twice a year, reflecting different timings for statistical data collection among countries. The first release (in June), features the data available at the time of publication, this year up to 2018; whereas the December release, has more complete data and expanded geographical coverage. We acknowledge and thank the enhanced commitment of our data providers.

Complementary to this documentation, the IEA has made available the energy efficiency indicators database availability file. This file mirrors the structure of the IEA Energy efficiency indicators database and provides detailed information about the data available in this database.

CO2 emissions by end use

For the first time, the database includes end-use level estimates of CO2 emissions from fuel combustion, including emissions reallocated from electricity and heat generation, across the four main final consumption sectors – residential, services, industry and transport. This reallocation allows for a different perspective, compared to when only direct emissions are considered, since it is possible to account for the emissions resulting from the consumption of electricity and heat across end-uses, which is quite significant in the final consumption sectors.

Qualifiers

Additionally, the use of qualifiers has been made more comprehensive and systematic, compared to previous editions of the energy efficiency indicators database. The IEA has tried to the extent possible to qualify the data points that are not available, instead of showing zeroes. This work has an implicit level of uncertainty, and hence, the IEA has adopted a conservative approach of qualifying only those data points for which there was no ambiguity.

Geographical coverage

The IEA is working closely with non-member countries, including association countries\(^1\) and other countries beyond IEA membership and association, in order to try to expand end use data coverage and track energy efficiency progress beyond IEA members. This year, this database continues to expand, and includes data for Chile and Lithuania (an IEA accession countries) for the first time.

As of now, this database encompasses end use data and energy efficiency indicators for two IEA association countries (Brazil and Morocco); and seven countries from Eastern Europe, Caucasus and Central Asia region (Armenia, Azerbaijan, Belarus, Georgia, Republic of Moldova, Ukraine and Uzbekistan). The collection of these data for the seven latter countries has been made possible with the financial assistance of the European Union, under the EU4Energy project.

Given the increasing importance of tracking energy efficiency progress worldwide, it is our wish that more countries may be contributing in future editions.

---

\(^1\) IEA association countries at the time of this publication are: Brazil, People's Republic of China, India, Indonesia, Morocco, Singapore, South Africa, and Thailand.
2. DATABASE STRUCTURE

The Energy efficiency indicators database includes annual data for:

- countries: 28 IEA member countries; 11 countries beyond IEA.
- years: 2000-2018, unless otherwise specified.

In its B2020 version, the database includes four files, as follows:

**EEI RESIDENTIAL.IVT  Residential sector detailed data and indicators**
- Residential energy end use (8 products; 17 end uses) (PJ);
- Residential energy indicators (6 flows);
- Residential activity data (6 flows);
- Residential emissions (1 product; 17 end uses) (MtCO2);
- Residential carbon indicators (4 flows);

**EEI SERVICES.IVT  Services sector detailed data and indicators**
- Services energy end use (8 products; 17 end uses) (PJ);
- Services energy indicators (5 flows);
- Services activity data (6 flows);
- Services emissions (1 product; 6 end uses) (MtCO2);
- Services carbon indicators (4 flows);

**EEI INDUSTRY.IVT  Industry sector detailed data and indicators**
- Industry energy use (8 products; 20 subsectors) (PJ);
- Industry energy indicators (2 flows);
- Industry activity data (6 flows);
- Industry emissions (1 product; 20 subsectors) (MtCO2);
- Industry carbon indicators (2 flows);

**EEI TRANSPORT.IVT  Transport sector detailed data and indicators**
- Transport energy end use (10 products; 17 end uses) (PJ);
- Transport energy indicators (5 flows);
- Transport activity data (5 flows);
- Transport emissions (1 product; 17 end uses) (MtCO2);
- Transport carbon indicators (4 flows);
- Transport activity indicators (6 flows).
The database in **excel version** is structured into several sheets, as follows:

<table>
<thead>
<tr>
<th>Category</th>

3. METHODOLOGICAL NOTES

The IEA energy efficiency indicators data collection

In 2009, IEA Members committed to collect energy efficiency indicators data through a new annual questionnaire. The questionnaire collects energy consumption and activity data for various end uses, subsectors and modes/vehicle types across the four sectors: residential, services, industry and transport. The questionnaire is available online at the IEA energy efficiency statistics web page: https://www.iea.org/reports/energy-efficiency-indicators.

The IEA also developed a manual on energy efficiency data and indicators, *Energy Efficiency Indicators: Fundamentals on Statistics*; and one on how to use indicators to inform policies, *Energy Efficiency Indicators: Essentials for Policy Making*, both of which can be downloaded from the above IEA web page.

Notes on data quality

The analysis of demand-side energy efficiency trends requires highly disaggregated end-use energy data across the main final consumption sectors: residential, services, transport and industry. Examples of such disaggregated data include energy consumption by end use (space heating, cooking, appliances, etc.) for the residential sector; or energy consumption by mode/vehicle type (passenger cars, motor-cycles, freight trucks, etc.) for transport. Deriving energy efficiency indicators also requires consistent “activity data” covering the wide range of activities specific to each subsector end use, such as floor area, passenger-kilometres, production of key manufacturing output (cement, aluminium, iron, etc.), number of employees in each service category, etc.

While almost all countries have developed energy statistics to produce national energy balances, more disaggregated end-use energy and activity data are not always as readily available. Therefore, the development of energy efficiency indicators generally requires additional efforts, such as mapping the different available data through administrative sources, setting up new data collections; but also establishing new institutional arrangements to share and manage the different data.

The IEA end-use data collection agreed in 2009 is still work in progress, with developing quality and coverage across Member countries. Currently, IEA countries generally have relatively detailed data for the industry sector thanks to well established data collections to develop energy balances. Relatively important progress has been observed in the coverage of the residential sector, while detailed data for the services sector still remain not available for many countries. The availability of transport data varies greatly across countries, with activity data (passenger-kilometres, tonne-kilometres, vehicle stock etc.) often requiring additional development.

Furthermore, as indicators are calculated as a ratio of energy consumption and corresponding activity, and as the various data may not be collected by the same institution, the data quality assessment is particularly important. For example, consistency of boundaries and definition between energy and activity data is essential to create meaningful indicators, and to analyse their trends. Data users should also be aware that small changes in intensities may be caused by uncertainty in measurement of energy or activity data, and thus weight should be given to long-term trends. Other important validation criteria include internal consistency, consistency
with external data sources, and plausibility (values of indicators need to fall within expected ranges to be meaningful). The IEA Secretariat is continuously working with member countries to improve the overall quality of the energy efficiency indicators database, including its consistency with the data provided by national administrations to develop the IEA energy balances and with the data reported by other organizations. We expect to keep improving data quality over time, and are grateful for the feedback to this publication received from the different data providers and data users. In any case, the Energy Efficiency Indicators database presents the most complete and updated data available.

### Comparability with the IEA energy balances

This publication is based on the IEA energy efficiency indicators data collection which is additional to that used for the IEA energy balances. Due to the emphasis on final end uses across sectors, some differences occur between the final energy consumption in this publication and the total final energy consumption reported in the IEA energy balances, for the following reasons:

- In this publication, non-energy use is excluded from final energy consumption;
- Energy consumption in ferrous metals (part of basic metals and called iron and steel in the IEA balances) also includes energy consumption and losses in transformation for blast furnaces and coke ovens, which are accounted under the energy and the transformation sectors in the IEA energy balances;
- Energy consumption in mining also include energy consumed to extract oil, gas and coal;
- Transport excludes pipeline transportation and fuel tourism;
- Military energy consumption is excluded, while it is included in the total final energy consumption in the IEA Energy Balances under the other non-specified category.

Besides these systematic differences, some discrepancies might occur due to the higher data disaggregation of this publication, and to the need to adapt different approaches/methodologies (e.g. bottom-up vs top-down) to collect or estimate these data at a country level. Additionally, for some countries different offices/institutions are responsible for preparing the energy balances and the energy efficiency data shown in this publication, which may also lead to unintended discrepancies.

For more information on IEA energy balances methodologies, please see the documentation of the World Energy Balances

### Estimates of CO₂ emissions by end use

The estimates of CO₂ emissions from fuel combustion presented in this publication are calculated using the IEA energy efficiency database, the IEA energy balances and the default methods and emission factors from the 2006 IPCC Guidelines for National Greenhouse Gas Inventories.

Fossil fuel categories in the energy efficiency indicators template (coal, oil, gas) are more aggregated than those within the IEA energy balances. Country-specific implied emission factor for oil, coal and gas are computed based on the mix of individual products reported within the IEA energy balances. CO₂ emissions from fuel combustion

\[ CO₂ = \text{Fuel consumption} \times \text{Emission factor}, \]

where:

- Fuel consumption = amount of fuel combusted,
- Emission factor = implied emission factor, based on the energy balances fuel mix and default emission factors

For more information on IEA energy balances methodologies, please see the documentation of the World Energy Balances.
balances. Emissions are then summed across all fuel categories to obtain total emissions for a given end use or sub-sector.

The IPCC methodology does not assign any CO$_2$ emissions to fuel use from biofuels, unless it is used in an unsustainable way. The IEA energy efficiency indicators database follows the same rationale, except in the case of the transport sector.

This is due to the fact that both “motor gasoline” and “diesel and light fuel oil” products are reported, for this energy efficiency indicators data collection, together with liquid biofuels. Hence it is not possible to split these from biofuels to estimate the respective carbon emissions. As a result, total final emissions from transport that contain any of these two energy products also include biofuels CO$_2$ emissions.

Emissions estimates could differ from those published in the IEA CO$_2$ emissions from fuel combustion database mainly because the energy consumption data may differ from the IEA energy balances (see previous section). Also, the IEA Secretariat estimates of CO$_2$ emissions from fuel combustion may not be the same as the figures that a country submits to the UNFCCC for a variety of reasons.

**Temperature correction**

The amount of energy required for space heating (and space cooling) is highly dependent on the ambient temperature, and this impact on energy consumption may easily mask the effects of energy efficiency improvements. For example, a country may dramatically reduce the amount of energy needed for space heating over a year simply due to an exceptionally warm winter. The opposite may also be true. The reduction in energy consumption due to the energy efficiency improvements in heating systems may be offset by an extra energy demand due to an extremely cold winter.

Therefore, in order to accurately monitor the evolution of energy consumption for space heating in the residential sector over time, it is essential to eliminate the impact of temperature variations and to analyse temperature-corrected data. In this publication one of the most common methodologies has been adopted for such correction, namely the use of heating degree days (HDD).

HDD are a simplified measure of the intensity and duration of cold weather over a certain period in a given location. The value of HDD for a period, for example a winter, is determined by subtracting for each day the average daily temperature from a base temperature (assumed to be the temperature below which heating systems are turned on), and then adding up this difference for the days of the period for which the average outside air temperature is lower than the base temperature. When the outside air temperature is equal to or higher than the base temperature, HDD are zero. The higher heating degree days, the colder the season, the greater the amount of energy required for space heating. HDD can be defined as:

$$HDD = \sum_{k=1}^{n} (T_{\text{base}} - T_k)$$

where:
- $T_{\text{base}}$ is the base temperature,
- $T_k$ is the average temperature of day $k$,
- $n$ is the total number of days in the given period.

As noted above, two factors are key for the calculation of HDD. The first is the base temperature, which should be set at the level of outside air temperature at which residents of a given region tend to turn on their heating systems. This level can vary across different regions depending on many factors, such as the ability to tolerate cold temperatures, the variety of building types, the thermal properties of buildings, the density of occupants, etc. For example, the base temperature in the United Kingdom is typically 15.5°C while in the United States it is typically 65°F (equivalent to 18°C). The base temperature should be carefully determined based on the characteristics of the region, since this choice will impact the temperature correction of the energy consumption data. It may also evolve in time, for example if people already turn on their thermostat at higher outside temperatures.

The second factor is the time series of average daily temperatures. For example, if the average temperature on one day is 5 degrees below the base temperature, there are five HDD for that day. To get the annual number of HDD, all positive values of HDD are summed for each day in the year.

When the national HDD figures are available, the data of energy consumption for space heating can be corrected for...
temperature variations. This publication uses a simplified methodology, which assumes that the elasticity for adjusting heating requirements is 1, as shown below:

\[ E_{\text{corr}} = E \times \left(1 - \frac{HDD_{\text{period average}}}{HDD_{\text{year i}}}\right) \]

where:
- \( E_{\text{corr}} \) is the temperature-corrected energy consumption for the year \( i \),
- \( E \) is the actual energy consumption in year \( i \),
- \( HDD_{\text{period average}} \) is the average heating degree days of the given period (2000-latest year), and
- \( HDD_{\text{year i}} \) is the total heating degree days in the year \( i \).

Such correction intends to remove the fluctuations in energy consumption due to fluctuations in temperature in the given year compared with the average temperature of a country. For example, if a year has 500 HDD and the annual average HDD for the country is 250, the corrected energy consumption for space heating would be half of the actual energy consumption. Of course, comparison of space heating efficiency indicators across countries is still difficult as a country on average experiencing colder temperatures than another country will need on average to consume more to heat the same floor area.

Similarly, cooling degree days (CDD) are a measure of the intensity of warm weather to correct energy consumption data for space cooling. In this publication, temperature correction are made only for calculating intensity indicators, therefore energy consumption data show the fluctuations due to temperature change. Space cooling is temperature corrected only for countries where CDD are data available.
### 4. END USE DEFINITIONS

<table>
<thead>
<tr>
<th>Flow</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Residential</td>
<td>R_TOTAL</td>
<td>Includes consumption by households, excluding fuels used for transport. Includes households with employed persons [ISIC Rev. 4 Divisions 97 and 98] which are a small part of total residential consumption. The different end uses within the residential sector are described below.</td>
</tr>
<tr>
<td>Residential space heating</td>
<td>R_SPACE_H</td>
<td>Represents the residential sector space heating end use. Space heating includes the different means of heating spaces, which can be achieved through many systems and fuels. Heating systems can be broadly separated into two types: central heating and dedicated area/room heating. Central heating systems can heat the entire dwelling; they include hot water and steam systems with radiators, floor or wall furnaces, district heating, heat pumps, etc. Area-dedicated heating systems can be divided into several categories: stand-alone electric heaters, fireplaces, and stand-alone stoves using oil products or other fuels, such as coal or wood. It is not rare that households use a combination of several systems, e.g. electrical heaters to complement insufficient base central systems. Heating systems can generate heat using a number of energy sources such as electricity, natural gas, coal, fuel oil, liquefied petroleum gas (LPG), kerosene, biofuels, and active or passive solar energy.</td>
</tr>
<tr>
<td>Residential space cooling</td>
<td>R_SPACE_C</td>
<td>Represents the residential sector space cooling end use. Space cooling includes all equipment used for cooling a living area, which can be divided into two broad categories: central cooling systems and room-dedicated systems. Central air conditioners feed into a duct system that could also be used by a central heating system. Wall air conditioners and split systems are used to cool a room. There are other possible cooling systems such as swamp coolers (or evaporative coolers), which cool air through evaporation of water; heat pumps that can be used in reverse mode to cool the air or district cooling. Most of the cooling systems in the residential sector run exclusively on electricity.</td>
</tr>
<tr>
<td>Residential water heating</td>
<td>R_WATER_H</td>
<td>Water heating, also known as domestic hot water, includes systems that are used for heating water for showers, bathing, washing, etc. A number of tank-based or tankless systems can be used to heat the water. Water heating can be produced alone or in combination with space heating systems. The main energy sources used by water heating systems include natural gas, LPG, electricity, biofuels and, increasingly, solar thermal energy in a growing number of countries.</td>

</thead>
<tbody>
<tr>
<td>Residential cooking</td>
<td>R_COOKING</td>
<td>Cooking includes energy consumed to cook meals using a wide range of stoves, from advanced induction stoves to traditional three-stone stoves. A number of energy sources are used for cooking such as natural gas, electricity, biofuels, LPG, kerosene and coal. Beside stoves, ovens are also included in the energy consumption for cooking. Cooking appliances such as toasters and microwave ovens, due to the difficulty in separating their respective consumption, are normally reported under other appliances.</td>
</tr>
<tr>
<td>Residential lighting</td>
<td>R_LIGHTING</td>
<td>Residential lighting includes energy consumed for interior or exterior lighting of dwellings today mainly powered by electricity. Incandescent lamps, which have been around for more than a century, are slowly being replaced by more efficient fixtures, e.g. fluorescent tubes, compact fluorescent lamps and LEDs (light-emitting diodes). More and more countries are passing regulations to phase out the use of incandescent bulbs. Households that do not have any access to electricity still rely on traditional forms of lighting such as kerosene and LPG lamps, and sometimes even candles and flashlights. Moreover, off-grid solar applications for lighting may become more prominent in the future.</td>
</tr>
<tr>
<td>Residential appliances</td>
<td>R_APPLIANC</td>
<td>Residential appliances encompasses two main categories: large (or major) appliances (sometimes also called white appliances or white goods) and other (usually much smaller) appliances. Residential appliances are disaggregated as below.</td>
</tr>
<tr>
<td>Refrigerators</td>
<td>R_REFRIG</td>
<td>Refrigerator can be defined as a box, room, or cabinet in which food, drink, etc., are kept cool by means of ice or mechanical refrigeration.</td>

</table>
| Memo: Coke and refined petroleum products [ISIC 19] | M_REFINING | This division includes the transformation of crude petroleum and coal into usable products [ISIC Division 19]. The dominant process is petroleum refining, which involves the separation of crude petroleum into component products through such techniques as cracking and distillation. This division also includes the manufacture for own account of characteristic products (e.g. coke, butane, propane, petrol, kerosene, fuel oil etc.) as well as processing services (e.g. custom refining).
This division includes the manufacture of gases such as ethane, propane and butane as products of petroleum refineries.
Not included is the manufacture of such gases in other units, manufacture of industrial gases (Class 2011), extraction of natural gas (methane, ethane, butane or propane) (Class 0600), and manufacture of fuel gas, other than petroleum gases (e.g. coal gas, water gas, producer gas, gasworks gas) (Class 3520).
The manufacture of petrochemicals from refined petroleum is classified in division 20. |
<p>| Agriculture, forestry and fishing [ISIC 01-03] | O_AGROFISH | Includes agriculture, forestry and fishing [ISIC Division 01 to 03]. |
| Mining [ISIC 05-09] | O_MINING | Covers mining and quarrying including coal, oil and gas extraction [ISIC Division 05 to 09]. |
| Construction [ISIC 41-43] | O_CONSTR | Includes [ISIC Divisions 41 to 43]. |</p>

<tr>
<td>Total passenger and freight transport</td>
<td>TOTAL</td>
<td>Transport covers all transport modes using commercial energy, independently of the sector where the transport activity occurs. As a consequence, cycling, walking or sailing are not covered in this sector, even though these modes could represent sizeable activities in terms of passenger-kilometres (pkm). Transport excludes international marine and aviation bunkers, pipeline transportation, and when possible fuel tourism (unlike world energy balances). The transport sector is divided by segment (passenger and freight), mode (road, rail, air and water) and by vehicle type (e.g. cars, motorcycles, etc.).</td>
</tr>
<tr>
<td>Total passenger transport</td>
<td>P_TOTAL</td>
<td>Includes all mode of transportation dedicated to transporting passengers.</td>
</tr>
<tr>
<td>Cars/light trucks</td>
<td>P_CARS</td>
<td>Includes passenger light-duty vehicles carrying up to eight persons, cars, minivans, sport utility vehicles and personal-use pickup trucks. ¹ Passenger cars cover a number of categories, such as taxis, hire cars, ambulances and motor homes.</td>
</tr>
<tr>
<td>Motorcycles</td>
<td>P_MCYCL</td>
<td>Includes powered 2- to 4-wheeled road motor vehicles not exceeding 400 kilograms.</td>
</tr>
<tr>
<td>Buses</td>
<td>P_BUS</td>
<td>Includes urban, suburban and intercity mini-coaches, trolleybuses, minibuses and bus vehicles.</td>
</tr>
<tr>
<td>Passenger trains</td>
<td>P_RAIL</td>
<td>Includes any movement of passengers through railway, on a given railway network, regional, urban or suburban, within the national boundaries. Passenger rail transport includes trains, metro vehicles and trams (streetcars). Rail transport can be powered by electricity, diesel or steam.</td>
</tr>
<tr>
<td>Domestic passenger airplanes</td>
<td>P_AIR</td>
<td>Includes passenger airplanes, aircrafts configured for the transport of passengers, used for domestic travels. For country-specific coverage, please refer to country notes.</td>
</tr>
<tr>
<td>Domestic passenger ships</td>
<td>P_WATER</td>
<td>Covers the movement of passengers, by any kind of vessel, boat or ship, undertaken at sea, or on lakes and rivers, within the national boundaries. International water transport is excluded from national totals, while inland waterways transport is included. For country-specific coverage, please refer to country notes.</td>
</tr>

5. PRODUCT DEFINITIONS

The Product dimension includes energy products and activity data, as described below.

<table>
<thead>
<tr>
<th>Flow</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oil and oil products (PJ)</td>
<td>E_OIL</td>
<td>Includes crude oil, natural gas liquids, refinery feedstocks, additives as well as other hydrocarbons (including emulsified oils, synthetic crude oil, mineral oils extracted from bituminous minerals such as oil shale, bituminous sand, etc., and oils from coal liquefaction), refinery gas, ethane, LPG, aviation gasoline, motor gasoline, jet fuels, kerosene, gas/diesel oil, fuel oil, naphtha, white spirit, lubricants, bitumen, paraffin waxes, petroleum coke and other oil products. Data shown for the transport sector in this publication present the disaggregation of oil products described below.</td>
</tr>
<tr>
<td>Motor gasoline (PJ)</td>
<td>E_GASOL</td>
<td>It is light hydrocarbon oil for use in internal combustion engines such as motor vehicles, excluding aircraft. Motor gasoline is distilled between 35°C and 215°C and is used as a fuel for land based spark ignition engines. Motor gasoline may include additives, oxygenates and octane enhancers, including lead compounds such as TEL (tetraethyl lead) and TML (tetramethyl lead). In this publication and differently from the IEA energy balances, motor gasoline for transport includes liquid biogasoline or ethanol.</td>
</tr>
<tr>
<td>Diesel and light fuel oil (PJ)</td>
<td>E_DIESEL</td>
<td>Includes diesel oil for fuel use in compression ignition (diesel) engines fitted in road vehicles. Distillation range is 160°C to 380°C. In this publication and differently from the IEA energy balances, diesel for transport includes liquid biodiesels.</td>
</tr>
<tr>
<td>LPG (PJ)</td>
<td>E_LPG</td>
<td>LPG are light paraffinic hydrocarbons derived from refinery processes, crude oil stabilisation plants and natural gas processing plants. They consist mainly of propane (C₃H₈) and butane (C₄H₁₀) or a combination of the two. They could also include propylene, butylene, isobutene and isobutylene. LPG are normally liquefied under pressure for transportation and storage.</td>
</tr>
<tr>
<td>Heavy fuel oil (PJ)</td>
<td>E_HFO</td>
<td>Fuel oil defines oils that make up the distillation residue. It comprises all residual fuel oils, including those obtained by blending. Its kinematic viscosity is above 10 cSt at 80°C. The flash point is always above 50°C and the density is always higher than 0.90 kg/l.</td>
</tr>
<tr>
<td>Flow</td>
<td>Short name</td>
<td>Definition</td>
</tr>
<tr>
<td>------</td>
<td>------------</td>
<td>------------</td>
</tr>
</tbody>
</table>
| **Jet fuel and aviation gasoline (PJ)** | E_JETF | Includes Gasoline type jet fuel and Kerosene type jet fuel as described below:

Gasoline type jet fuel includes all light hydrocarbon oils for use in aviation turbine power units, which distil between 100°C and 250°C. This fuel is obtained by blending kerosenes and gasoline or naphtha in such a way that the aromatic content does not exceed 25% in volume, and the vapour pressure is between 13.7 kPa and 20.6 kPa. Additives can be included to improve fuel stability and combustibility.

Kerosene type jet fuel is a medium distillate used for aviation turbine power units. It has the same distillation characteristics and flash point as kerosene (between 150°C and 300°C but not generally above 250°C). In addition, it has particular specifications (such as freezing point) which are established by the International Air Transport Association (IATA). It includes kerosene blending components. Kerosene type jet fuel excluding the liquid biofuels blended with jet kerosene. |
| **Gas (PJ)** | E_GAS | Gas includes natural gas (excluding natural gas liquids). |
| **Coal and coal products (PJ)** | E_COAL | Coal includes all coal, both primary (including hard coal and lignite) and derived fuels (including patent fuel, coke oven coke, gas coke, BKB, gas works gas, coke oven gas, blast furnace gas and other recovered gases), as well as peat (including peat products) and oil shale. |
| **Biofuels and waste (PJ)** | E_WOOD | Biofuels and waste comprises solid biofuels, liquid biofuels, biogases, industrial and municipal waste. Biofuels and waste data are often based on incomplete information, with particularly high caution on data quality.

Solid biofuels are defined as any plant matter used directly as fuel or converted into other forms (e.g. charcoal) before combustion. This covers a multitude of woody materials generated by industrial process or provided directly by forestry and agriculture (firewood, wood chips, bark, sawdust, shavings, chips, sulphite lyes also known as black liquor, animal materials/waste and other solid biofuels).

Liquid biofuels include biogasoline, biodiesel and other liquid biofuels. Liquid biofuels consumed in the transport sector are included, in this publication, under motor gasoline and diesel.

Biogases comprise landfill gas, sewage sludge gas and other biogases from anaerobic fermentation.

Note that biofuels refer only to the amounts of biomass specifically used for energy purposes. Therefore, the non-energy use of biofuels is null by definition.

Municipal waste consists of products that are combusted directly to produce heat and/or power and comprises waste produced by households, hospitals and the tertiary sector that are collected by local authorities for incineration at specific installations.

Industrial waste of non-renewable origin consists of solid and liquid products (e.g. tyres) combusted directly, usually in specialised plants, to produce heat and/or power. |
<table>
<thead>
<tr>
<th>Flow</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heat (PJ)</td>
<td>E_DHEAT</td>
<td>Heat includes all heat produced by main activity producer CHP and heat plants, as well as heat sold by autoproducer CHP and heat plants to third parties. Fuels used to produce quantities of heat for sale are included in transformation processes under the rows CHP plants and Heat plants. The use of fuels for heat which is not sold is included under the sectors in which the fuel use occurs.</td>
</tr>
<tr>
<td>Electricity (PJ)</td>
<td>E_ELEC</td>
<td>Electricity includes electricity generated from all sources.</td>
</tr>
<tr>
<td>Other sources (PJ)</td>
<td>E_OTHER</td>
<td>Other includes all the forms of energy not included in the list above (e.g. geothermal and solar thermal heat direct use etc.).</td>
</tr>
<tr>
<td>Total final energy (PJ)</td>
<td>E_FINAL</td>
<td>Represents total consumption of energy including all the products listed above.</td>
</tr>
<tr>
<td>Total Final Emissions</td>
<td>C_FINAL</td>
<td>Represents total CO₂ emissions from all reported energy uses of fuels, excluding emissions from non-energy use of fuels and from biofuels and waste, and including emissions reallocated from electricity and heat generation. The IPCC methodology does not assign any CO₂ emissions to fuel use of biofuels per se, unless it is used in an unsustainable way. This is true for all the sectors except for the transport sector where “motor gasoline” and “diesel and light fuel oil” products also include liquid biofuels. Therefore, total final emissions from the transport flows that contain any of these 2 products also account for biofuels CO₂ emissions.</td>
</tr>

1. Consistent with the IEA (2020) CO₂ emissions from fuel combustion publication.
7. COUNTRY NOTES

IEA MEMBER COUNTRIES

GENERAL NOTES
The notes given in this section refer to data for the years 2000 to 2018 published in this book, as well as on the online data service.

Data are generally obtained from national administrations through annual submission of the energy efficiency indicators questionnaire. In case other sources are used, e.g. the Odyssee database, this is indicated in the relevant country sources section.

In case of estimates made by the IEA Secretariat, explanations of the estimates are provided in the respective country notes.

Australia

Sources
Australian Government, Department of Industry, Science, Energy and Resources.

Years covered

General note
All energy data refer to financial years (e.g. July 2017 to June 2018 for 2018). The macroeconomic activity data are of calendar year (e.g. January 2018 to December 2018 for 2018). There may be some discrepancies between the IEA energy efficiency indicators and the IEA energy balances data. Work is ongoing to improve consistency.

Residential sector
Data for TVs include TVs only. Data for home entertainment are reported under other appliances.

Data for energy consumption of swimming pools and spas are included under other appliances. Data for energy consumption of natural gas for swimming pools and spas are included in other appliances, other energy sources.

Data for energy consumption and stocks of refrigerators are not available.

Industry and services sectors
Data for energy consumption of paper and printing [ISIC 17-18] also include wood [ISIC 16].

Data for value added of wood [ISIC 16], pulp and paper [ISIC 17], printing [ISIC 18] and non-metallic minerals [ISIC 23] are available from the year 2011 onwards.

Data for value added of ISIC 13-15 [textiles] are not available since the year 2017.

Data for energy consumption and value added for chemicals [ISIC 20-21] also include rubber and plastics [ISIC 22] and manufacture of coke and refined petroleum products [ISIC 19].

Data for energy consumption and value added for machinery [ISIC 25-28] include transport equipment [ISIC 29-30].

Data for value added for paper and printing [ISIC 17-18] and other manufacturing [ISIC 31-32] are not available.

Data for services employment are not available for the year 2018.
Transport sector
Data for passenger-kilometres of motorcycles have been revised for the whole time series.
Data for tonne-kilometres of freight trucks have been revised since 2016, and show a break for this year.
Data for vehicle stocks of buses have been revised for the whole time series.
Data for natural gas consumption of freight trains are reported under other fuels category.

Austria

Sources
Austrian Energy Agency; Odyssee database.

Years covered

Residential sector
The data series for space heating since 2005 and the whole time series for lighting have been significantly revised. This may lead to some breaks in time series for these end uses.
Data on energy consumption for space cooling and per appliance type, as well as data on appliances stocks and diffusion for the year 2018 are not available.

Industry and services sectors
Some data for energy consumption from natural gas and electricity for some industry subsectors are based on IEA estimates.
Data for value added of some industry subsectors [ISIC 16, 17-18, 22, 23, 24, 31-32] for the year 2018 are based on country estimates.
Data for value added for manufacture of machinery [ISIC 25-28] for the year 2018 does not include ISIC 25.

Transport sector
There are some discrepancies between the IEA energy efficiency indicators and the IEA energy balances databases. Work is ongoing to improve data consistency.
Data for energy consumption of passenger cars, buses, passenger trains, freight road transport, and freight trains for the year 2018 are not available.
Data for passenger-kilometres of passenger airplanes and tonne-kilometres of freight ships for the year 2018 are not available.
Data for energy consumption and activity (passenger-kilometres and tonne-kilometres) of freight airplanes and passenger ships are not available. Their energy consumption might be partially included under passenger airplanes and freight ships data, respectively.

Belgium

Sources
Direction générale Energie – Ministry of Energy; Odyssee database.

Years covered

Residential sector
Data for energy consumption of the residential sector by end use are available from the year 2010 onwards.
Data for energy consumption of residential appliances include lighting.
Data for energy consumption of residential appliances are available as a total included under other appliances.
Data for stocks of freezers, refrigerator/freezer combinations and clothes dryers for 2011-2018 are from a recent study, awaiting validation.

Industry and services sectors
Some data for energy consumption from natural gas and electricity for some industry subsectors are based on IEA estimates.
Data for value added of some industry subsectors [ISIC 16, 17-18, 22, 23, 24, 31-32] for the year 2018 are based on country estimates.
Data for value added for manufacture of machinery [ISIC 25-28] for the year 2018 does not include ISIC 25.

Transport sector
Some activity data have been revised since 2013, due to a change in the data collection methodology that affects road transport modes.
Data for electricity consumption in passenger trains includes trams, while activity data (passenger-kilometre) does not. Indicators should be considered carefully in this sense.
There is a break in 2012 on the consumption of diesel and light fuel oil data for freight trains, which is under investigation, and may be subject to revisions in the future.
Data for energy consumption for domestic freight airplanes and domestic passenger ships are not available; it may be partially included in domestic passenger airplanes and domestic freight ships, respectively.

Transport activity data for passenger-kilometres, tonne-kilometres and vehicle-kilometres are not available for 2018.

### Canada

#### Sources
Natural Resources Canada, Statistics Canada.

#### Years covered

#### General notes
Differences between the IEA energy efficiency indicators and the IEA energy balances result from different timing of reporting requirements, sources used, as well as definitions and scope of coverage. Work is ongoing to align the two databases.

Detailed energy use information for Canada is available at [Canada’s National Energy Use Database](#).

### Industry and services sectors
There were some revisions of energy consumption data for some industry subsectors.

Data reported in some fuel categories has been combined with other fuels, due to confidentiality issues. For example, energy consumption from electricity and renewables and waste are combined in the food [ISIC 10-12] subsector.

The energy consumption for the non-metallic minerals [ISIC 23] for the years 2014 and 2015, as well as some other data points for energy consumption from oil products, coal, heat and electricity of ISIC 23, were estimated by the IEA Secretariat.

Data for value added for Canada are based on price levels of 2012, instead of 2015 as for other countries.

### Transport sector
Data for buses include urban/local light rails (metro trains, light trains and urban buses).

Data on the energy use for air transport include both domestic and international transport. The energy use and activity data for water transport include domestic and trans-border, but exclude other international transport.

Differences in road transport between the IEA energy efficiency indicators database and the IEA energy balances may be due to reallocation of energy consumption from motor gasoline and diesel between the services and the transport sector, with an impact data consistency for both sectors

### Czech Republic

#### Sources
Czech Statistical Office and Ministry of Industry and Trade; Odyssee database.

#### Years covered
2000-2018 (partially).

### Residential sector
Data for energy consumption for space cooling are available from 2015 onwards.

Data on end use energy consumption since 2016 have been collected based on a different methodology than previous time series (a new residential survey), leading to breaks on energy consumption data in 2016 (e.g. clothes washers and dryers), and also on appliances stocks data.

Data on energy consumption of refrigerators, refrigerators/freezer combinations, clothes dryers, PCs and other appliances for the year 2015 are estimated by the IEA Secretariat.

Data for energy consumption of clothes dryers are available from 2004 onwards.

### Industry and services sectors
Some discrepancies between the IEA energy efficiency indicators and the IEA energy balances figures might occur. Work is ongoing to improve the consistency of both databases.

Data for energy consumption for manufacture of rubber and plastics [ISIC 22] and other manufacturing [ISIC 31-32] are available from the years 2007 onwards.

Data for energy consumption for electricity, gas, steam, air conditioning supply and water collection, treatment and supply [ISIC 35-36] are only available from 2007 to 2009 and from 2017 to 2018.
Data for heat consumption for manufacturing and casting of iron and steel [ISIC 2410 and 2431] for 2015 and 2016 are based on IEA estimates.

Data for heat consumption for manufacture of wood & wood products [ISIC 16] have been revised from 2000 to 2002.

Data for value added of manufacture of coke and refined petroleum products [ISIC 19] are not available for the years 2010-2014 and 2017-2018.

**Transport sector**

Data for vehicle-kilometres of passenger cars between 2011 and 2016, and for passenger trains and domestic passenger ships for the year 2016 are estimated by the IEA Secretariat.

Data for vehicle-kilometres of motorcycles, buses, and freight road transport are only available for the years 2000, 2005 and 2010.

Data for consumption of oil products for passenger cars, buses, freight trucks, passenger trains and freight trains are not available for the year 2018.

Data on energy consumption and passenger-kilometres of motorcycles are not available.

Data for number of dwellings and residential floor area for the year 2018 are not available.

**Industry and services sectors**

Data for energy consumption of rubber manufacturing [ISIC 22] for the year 2018 are not available.

Data for space heating in services for the year 2018 are not available, and are reported under other energy use in the services sector for this year.

Data for services floor area for the year 2018 are not available.

**Transport sector**

Data for activity and energy consumption split by segment/mode/vehicle type for the transport sector for the year 2018 are not available.

Data for passenger-kilometres of motorcycles are not available.

Data for tonne-kilometres of freight road transport include only Danish registered vehicles with a capacity of over 6 tonnes.

Data on energy consumption of passenger ships and freight airplanes are not available, and may be partially included under freight ships and passenger airplanes, respectively.

---

**Denmark**

**Sources**

Danish energy agency through the Odyssee database.

**Years covered**

2000-2018 (partially).

**General note**

There may be breaks in some time series due to data revisions.

**Residential sector**

Data for energy consumption split by end use, and data for appliances stocks for the year 2018 are not available.

Data for energy consumption of water heating are included under space heating. Data for energy consumption for lighting are included under other appliances.

Data for refrigerators and PCs are not available.

---

**Finland**

**Sources**

Statistics Finland and Motiva.

**Years covered**

2000-2018 (partially).

**General note**

Some discrepancies between the IEA energy efficiency indicators and the IEA energy balances may occur. Work is ongoing to improve consistency between the two datasets.

**Residential sector**

Data on energy consumption for space heating, and also on the number of dwellings, excludes summer houses.

Data on residential floor areas includes common heated areas of buildings, and excludes summer houses.
Data for energy consumption for space cooling are available from the year 2015 onwards.

Data for appliances stocks and unit energy consumption for several years are based on IEA Secretariat estimates and are discontinued since the year 2018.

Data for energy consumption by appliance type are based on IEA Secretariat estimates and are discontinued since the year 2018. Data for PCs are not available.

Data for energy consumption for other appliances includes electric saunas and electric pre-heating of cars.

### Industry and services sectors

Data for energy consumption of rubber manufacturing [ISIC 22] are not available due to confidentiality issues.

Data for energy consumption from heat for several industry subsectors up to 2006 are based on IEA Secretariat estimates.

Data for “Other building energy use in services sector” includes energy consumption for water heating, lighting, appliances, and street lighting.

### Transport sector

Data for passenger-kilometres (pkm) of motorcycles are the same as the respective vehicle-kilometre (vkm) data (the latter being based on the LIPASTO model), assuming a one-person occupancy for motorcycle trips, in the absence of more accurate data for pkm.

Data for passenger-kilometres (pkm) of passenger airplanes are not available since the year 2006, which affects total pkm of passenger transport. Data for tonne-kilometres for freight airplanes are not available.

Data for stocks of rail, air, and water transport are not available.

Data for vehicle kilometres for air and water transport are not available.

Vehicle stocks data refer to vehicles registered in the country and not vehicles in circulation.

The energy consumption from diesel and light fuel oil for passenger ships may be reported together with domestic freight ships up to 2009.

Data on energy consumption of freight airplanes are not available and may be partially included under passenger airplanes.

Data for energy consumption of ice-breakers are included in freight ships.

### France

#### Sources

Ministère de la transition écologique et solidaire (SDES – service de la donnée et des études statistiques); Odyssee database.

#### Years covered

#### General note

From 2011 onwards, energy consumption and activity data for France include Monaco, and the following overseas departments (Guadeloupe, French Guiana, Martinique, Mayotte, and Réunion); and excludes the overseas collectivities (New Caledonia; French Polynesia; Saint Barthélemy; Saint Martin; Saint Pierre and Miquelon; and Wallis and Futuna). For the transport sector both activity and energy consumption data refer only to metropolitan France. Considering overseas departments in transport would have led to significant breaks in the data reported and corresponding indicators (especially in the case of air transport if accounting for long haul flights).

#### Residential sector

Data for energy consumption have been revised from the year 2010 across end uses and energy products.

Data for energy consumption and stocks of PCs are not available.

### Industry and services sectors

There may be breaks for some industry subsectors for the consumption of electricity and natural gas for the year 2011, due to a new data collection methodology based on an annual industry survey.

Some data for energy consumption from natural gas and renewables for some industry subsectors before the year 2004 are based on IEA Secretariat estimates.

Data for electricity and oil & oil products consumption for construction [ISIC 41-43] were revised from 2011 onwards, based on a new survey in 2014.

Data for energy consumption for the services sector from biofuels and waste, heat, and electricity before the year 2014 are based on IEA Secretariat estimates.

Data for biofuels and waste for space heating in the services sector includes solar thermal since the year 2014.

Data for electricity consumption for services space heating includes electricity consumption from heat pumps.
Transport sector
Activity data for road transport refer to vehicles registered, not in circulation (in metropolitan France).
Data for energy consumption for passenger airplanes has been historically revised, due to a methodological change.

Germany

Sources

Years covered

General note
Some discrepancies between the IEA energy efficiency indicators and the IEA energy balances may occur. Some differences result from different data scope and definitions. Work is ongoing to align these two datasets.

Residential sector
Data for energy consumption for cooking have been reviewed for the whole time series and for space heating and water heating from 2006 onwards.
There is a break in the time series for floor area of dwellings, for the year 2010, which may affect residential energy intensities. This may be due to the results of the building and housing census from 2011 onwards.
Data for space cooling are available from 2010 onwards. PCs data are not available.
Data for energy consumption from other appliances for the years 2014 and 2015 are estimated by the IEA Secretariat.

Industry and services sectors
Data for energy consumption for electricity, gas, steam, air conditioning supply and water collection, treatment and supply [ISIC 35-36] and construction [ISIC 41-43] are not available.
Data for energy consumption of agriculture, forestry and fishing [ISIC 01-03] are based on a national survey. However, these are not consistent with the IEA energy balances database. Work is ongoing to improve alignment between the two databases.
Data for value added for manufacturing subsectors for the year 2018 are not available.
Data for energy consumption of the services sector split by end use are available from 2001 onwards.

Transport sector
Data for vehicle-kilometres and energy consumption for motorcycles, buses and trucks show a significant break in 2017 due to a revision confirmed by the country.

Greece

Sources
Ministry for Environment and Energy (CRES) through the Odyssee database.

Years covered
2000-2018 (partially).

Residential sector
In 2013, taxation on oil products for space heating increased substantially, leading to reduced consumption in the residential sector. According to external sources, the consumption of oil products has been partially replaced by non-commercial solid biofuels not yet reported. This leads to a significant reduction of total space heating consumption in 2013, affecting also the energy intensity of this end use. The space heating intensity shown should, thus, be considered with caution.
Data for the energy consumption for other appliances includes lighting.
Data for energy consumption split by appliance type are not available since the year 2014, and data for energy consumption and stocks of PCs are not available.
Data for appliances stocks, number of dwelling and residential floor areas for the year 2018 are not available.

Industry and services sectors
Data on energy consumption of rubber manufacturing [ISIC 22] are included under manufacturing not elsewhere specified.
Value added data for the year 2018 are not available.
Data for energy consumption for cement production are not available since the year 2010.

**Transport sector**

Data for activity and energy consumption split by segment/model/vehicle type for the transport sector (except vehicle stocks) for 2018 are not available.

Data for passenger-kilometres for motorcycles are based on IEA Secretariat estimates and discontinued since 2015.

Data for vehicle-kilometre of buses and freight trucks from 2000 to 2009 are based on IEA Secretariat estimates.

The full amount of energy consumption from water transport is allocated to freight ships.

The full amount of energy consumption from air transport is allocated to passenger airplanes.

### Hungary

**Sources**

Hungarian Energy and Public Utility Regulatory Authority; Odyssee database.

**Years covered**

**General note**

Some breaks in energy consumption data may occur in 2013, resulting from an energy consumption survey introduced in 2014. For instance, some energy consumption was reallocated between industry and services sectors.

### Residential sector

Some data for energy consumption across residential end uses for different fuels and years are based on IEA Secretariat estimates.

Data for energy consumption for other appliances includes all residential appliances and lighting, and may include cooling up to 2010. Data for energy consumption for space cooling is reported separately since the year 2011.

Data for stocks and diffusion of dish washers are available from 2002 onwards. Data for stocks and diffusion of clothes dryers are available from 2006 onwards.

Data for unit energy consumption of appliances are not available.

### Industry and services sectors

Data for energy consumption for rubber and plastics [ISIC 22] and for other manufacturing [ISIC 31-32] are reported separately from 2013 onwards.

There are some breaks in time series of value added data. Specifically, data for value added of basic metals [ISIC 24] show a significant decrease in 2009, leading to a considerably higher intensity in that year. This does not necessarily reflect physical intensities, as it is based on economic data.

Data for energy consumption of the service sector split by end use are not available.

### Transport sector

Data for energy consumption and activity (passenger-kilometres) for passenger cars include motorcycles.

Data for activity (passenger-kilometres) for passenger trains from 2000 to 2006 are based on IEA Secretariat estimates.

Data for activity (tonne-kilometres) of freight transport include both domestic and international transport.

Data for vehicle-kilometre of passenger car and occupancy are not available after 2010.

Data for activity and energy consumption of air transport are not available.

Data for energy consumption of passenger and freight trains from 2011 to 2014 are based on IEA Secretariat estimates.

Data for energy consumption for freight ships include passenger ships up to the year 2012.

### Ireland

**Sources**

Sustainable Energy Authority of Ireland.

**Years covered**

### Residential sector

Data for electricity and oil & oil products in the residential sector up to the year 2015 are based on IEA Secretariat estimates. Data for natural gas in the residential sector up to the year 2014 are based on IEA Secretariat estimates. Energy consumption data for other fuels may show some breaks in the year 2016, due to a new data collection methodology adopted since then.
Data for energy consumption from biofuels and waste for water heating is available from 2016 onwards, and is based on IEA secretariat estimates for the years 2016-2017.

Data for energy consumption for space cooling, lighting and residential appliances split by appliance type are not available. Data for lighting may be reported with other appliances.

Data for appliances stocks for refrigerators and PCs are not available.

**Industry and services sectors**

Data for value added of [ISIC 20-21] includes only [ISIC 21]. Data for value added of [ISIC 25-28] includes only [ISIC 25 and 27] from the year 2015 onwards. Data for value added of services sector doesn’t include [ISIC 33] from the year 2015 onwards.

Due to confidentiality issues, value added of [ISIC 20-21] and [ISIC 31-32] is not available since the year 2015.

Energy consumption data for the manufacture and casting of iron and steel [class 2410+2431] since the year 2015 are not available, due to confidentiality issues. It is reported under Basic metals [ISIC 24] together with manufacture and casting of precious and non-ferrous metals [class 2420+2432].

**Transport sector**

Discrepancies between the IEA energy efficiency indicators and the IEA energy balances for oil products are due to different reporting sources. Work is ongoing to align the two datasets.

Data for passenger-kilometres of passenger cars and buses are not available from the year 2016 onwards.

Data for tonne-kilometres of ships are not available after 2008.

Data for energy consumption of freight road transport exclude light duty vehicles.

Data for energy consumption of motorcycles and freight trains are not available.

Data for energy consumption of passenger ships and freight airplanes are not available, and may be partially included under freight ships and passenger airplanes, respectively.

---

**Italy**

**Sources**

Ministry of Economic Development, Terna and ENEA; Ricerca Sistema Energetico (RSE).

**Years covered**

**Residential sector**

Data for electricity consumption for water heating was partially revised since 2010 following national updates on electrical water heater stocks.

Data for electricity consumption for freezers and refrigerator/freezer combinations have been revised since 2011 due to new data collection methodology.

**Industry and services sectors**

Data for energy consumption of some industry subsectors for natural gas and heat for the years 2000-2003 are based on IEA Secretariat estimates.

Data for energy consumption of manufacture of rubber and plastics [ISIC 22] are included in manufacturing not elsewhere specified.

Data for energy consumption of metal products and machinery [ISIC 25-28] includes manufacture of motor vehicles [ISIC 29-30].

Data for value added of some industry subsectors [ISIC 16, 17-18, 22, 23, 24, 25-28, 31-32] for the year 2017 and 2018 are based on IEA Secretariat estimates.

**Transport sector**

Data for vehicle stocks of buses, passenger ships are not available for the year 2018; and for stocks of freight airplanes, and freight ships for the years 2017 and 2018.

---

**Japan**

**Sources**

Ministry of Economy Trade and Industry (METI), Agency for Natural Resources and Energy; and Institute of Energy Economics (IEEJ).
Years covered

General note
There may be some discrepancies between the IEA energy efficiency indicators and the IEA energy balances data. Work is ongoing to improve consistency.

Residential sector
Data for energy consumption of the residential sector, across end uses has been revised for the whole time series.
Data for energy consumption for residential appliances include lighting.
Data for energy consumption of residential appliances disaggregated by appliance type are not available.
Data for stocks and diffusion of dishwashers are available from 2004 onwards. Data for stocks of refrigerators and freezers are not available.
There is a break in stocks of clothes dryers for the year 2013 as, from this year onwards, it includes bathroom dryers.

Industry and services sectors
Data for value added of [ISIC 13-15] includes only [ISIC 13] and value added of [ISIC 17-18] includes only [ISIC 17]. Data for value added of [ISIC 25-28] does not include [ISIC 26] and data for value added of wood [ISIC 16] are not available.
Data for energy consumption for manufacture of rubber and plastics [ISIC 22], for manufacture of cement and for other manufacturing [ISIC 31-32] are not available.

Transport sector
Data for vehicle-kilometres and energy consumption for passenger cars and buses have been revised for the whole time series.
Data for tonne-kilometres, vehicle-kilometres and energy consumption for freight trucks have been revised for the whole time series.
Data for passenger-kilometres and vehicle-kilometres of motorcycles are not available.

Data for vehicle-kilometres of freight trains are not available after the year 2012, and for domestic freight airplanes and domestic freight ships data are not available for the whole time series.

Korea

Sources
Korea Energy Economics Institute.

Years covered

Residential sector
Data for energy consumption from biofuels and waste for space heating includes water heating until the year 2016.
Data for other appliances include electricity consumption for cooking and night-time electricity, which represents mostly space heating. This may affect related end-use indicators. For the years 2017 and 2018, these are IEA based on secretariat estimates.
Data for energy consumption of refrigerators/freezer combinations includes refrigerators before 2002.
Data for energy consumption and stocks of freezers and clothes dryers are not available.

Industry and services sectors
Data for energy consumption for manufacture of rubber and plastics [ISIC 22] are included under manufacturing not elsewhere specified.

Transport sector
Data for passenger-kilometres of passenger cars and buses have been revised for the whole time series. Passenger-kilometres of cars are available starting in the year 2011.
Data for tonne-kilometres of freight trucks and domestic freight ships have been revised for the whole time series and are available from 2001 onwards.
Data for vehicle-kilometres of passenger cars, buses, passenger trains, domestic passenger airplanes, freight trucks and freight trains have been revised for the whole time series. Data for vehicle-kilometres of passenger ships, freight airplanes and freight ships are not available.
Data for passenger cars include passenger vans (up to 15 passengers).
Data for energy consumption from LPG for passenger cars are based on IEA estimates.

**Luxembourg**

**Sources**
STATEC–NSI Luxembourg.

**Years covered**

**General note**
There may be some discrepancies between the data in this publication and the one in the IEA energy balances database.

**Residential sector**
Data for energy consumption disaggregated by end use are available from the year 2008 onwards.
Data for energy consumption of residential appliances disaggregated by appliance type are not available.
Data for diffusion of appliances are available only for the years 2001 and 2011 and for stocks for the year 2011.

**Industry and services sectors**
Data for heat consumption in industry is available from 2003 onwards.
Data for energy consumption from biofuels and waste in wood manufacturing [ISIC 16] are available from 2005 onwards.
Due to confidentiality issues, data for energy consumption of chemicals [ISIC 20-21] includes rubber [ISIC 22], whereas value added of rubber [ISIC 22] is included in the manufacture of non-metallic mineral products [ISIC 23]. For this reason the corresponding intensities are not calculated.
Data for value added of basic metals [ISIC 24], machinery [ISIC 25-28], motor vehicles [ISIC 29-30], and other manufacturing [ISIC 31-32] are not available. Value added of ISIC [20-21] includes only ISIC 20.
Data for energy consumption for the services sector by end use are not available.

**Transport sector**
Data for passenger-kilometres of motorcycles, passenger airplanes and passenger ships are not available.

Data for tonne-kilometres of freight airplanes for the whole time series and for freight ships for the year 2018 are not available.

Data for vehicle-kilometres and occupancy of passenger cars and freight road transport are available from 2008 onwards.

Data for energy consumption of motorcycles, freight airplanes and freight ships are not available.

The full amount of energy consumption in water transport is allocated to passenger ships.

There were some historical revisions of data for energy consumption from motor gasoline and diesel for passenger cars, for buses, and for freight trucks.

Data for diesel and light fuel oil consumption for domestic passenger ships have been revised since 2015.

Data for diesel and light fuel oil consumption for freight trains have been revised since 2012.

**Mexico**

**Sources**
CONUEE – Comisión Nacional para el Uso Eficiente de la Energía.

**Years covered**

**Residential sector**
The data coverage of end use energy consumption of the residential sector in Mexico is limited. Work is ongoing (including a new household survey) to improve the availability of residential end use data. This should be included in future editions of this database.

Data for floor area of dwellings for the years 2016 and 2017 are based on IEA Secretariat estimates.

Data on appliances stocks are available only for refrigerators, clothes washers and TVs, and are not available for the year 2017 at the time of this release. It refers to stocks in households, not in dwellings like for other countries.

**Industry and services sectors**
The electricity consumption of the services sectors may be partially included in the industry sector due to the current data collection methodology.
Data for energy consumption split by end use in the services sector are not available.

Data on floor area of services are not available.

Data for value added are based on price levels and PPP of 2010, instead of 2015 as for other countries.

**Transport sector**

Data for energy consumption split by transport mode / vehicle type are not available. Work is ongoing to publish the split of energy consumption for transports in the future.

Activity data for passenger transport (passenger-kilometre) are only available for domestic passenger airplanes, and domestic passenger ships, the latter from 2010 onwards.

Activity data for freight transport (freight-kilometres) for domestic freight airplanes and domestic freight ships are available from 2010 onwards.

Vehicle-kilometres, passenger occupancy and data on freight loads are not available.

**Netherlands**

**Sources**

Organisatie voor Toegepast Natuurwetenschappelijk Onderzoek (TNO) through the Odyssee database.

**Years covered**

2000-2018 (partially).

**Residential sector**

Data for energy consumption split by end use, and data for appliances stocks and diffusion for the year 2018 are not available.

Data for energy consumption for biofuels and waste for space heating before 2010 are based on IEA Secretariat estimates.

Data for energy consumption and appliances stocks of refrigerators and PCs are not available.

Data for occupied dwellings for the years 2009 and 2010 are estimated by the IEA Secretariat.

**Industry and services sectors**

Heat consumption for casting of precious and non-ferrous metals [ISIC 2420+2432] up to the year 2011 is based on IEA Secretariat estimates.

Data for energy consumption for manufacturing of cement are available up to 2010.

Data for energy consumption for manufacturing of rubber and plastic [ISIC 22] are included in manufacturing not elsewhere specified.

Data for energy consumption for the services sector split by end use are not available for the years 2017 and 2018. Total services energy consumption for the services sector for the years 2017 and 2018 are reported in other building energy use in services.

Data for value added for the year 2018 are not available.

Data on services floor area for the year 2018 is not available.

**New Zealand**

**Sources**

Ministry of Business, Innovation & Employment (MBIE).

**General note**

Most of the data for 2018 are based on national early estimates. These data may be updated in the next edition of this database.
Years covered

Residential sector
Data for natural gas consumption across end uses and for oil and oil products for space heating for the years 2014-2018 are based on country and IEA Secretariat estimates. The country is working to review these data, which may be updated in the next edition of this database.

Data for unit energy consumption of dish washers for the year 2016 and of televisions and PCs for 2016-2018 are based on IEA Secretariat estimates.

Industry and services sectors
Data for consumption of natural gas in manufacture of wood and wood products [ISIC 16] up to the year 2013 are based on IEA secretariat estimates.

Data for value added for chemicals [ISIC 20-21] includes rubber [ISIC 22] and manufacture of coke and refined petroleum products [ISIC 19].

Data for energy consumption of the services sector split by end use are not available.

Transport sector
There may be some discrepancies between the IEA energy efficiency indicators and the IEA energy balances databases. Work is ongoing to align the two datasets.

Data for diesel and light fuel oil consumption for passenger and freight trains for the years 2017 and 2018 are based on IEA secretariat estimates.

Poland

Sources
Statistics Poland.

Years covered
2000-2018 (partially).

Residential sector
Data on energy consumption for water heating and appliances are available from 2015 onwards.

Data on energy consumption for appliances includes lighting, and data for energy consumption split by appliance type and for space cooling are not available.

Data for stocks of PCs and clothes dryers are not available. Data for refrigerators, freezers and refrigerator/freezer combinations stocks are based on IEA secretariat estimates for the years 2010-2011, 2013-2014, 2016-2017.

Industry and services sectors
Data for energy consumption of the services sector split by end use are not available.

Data for energy consumption of the services sector includes water supply and treatment [ISIC 36].

Data on natural gas consumption for services have been collected based on a new methodology for the year 2017, leading to a break in this year.

Data on floor area for the services sector are not available.

Data on value added for manufacture of coke and refined petroleum products [ISIC 19] and total manufacturing before the year 2005 are not available. Data for value added by manufacturing subsector [ISIC 10-32] and for services are also not available for the year 2018.

Transport sector
Data on passenger-kilometres of cars are not available for the year 2018. Data on passenger-kilometres of motorcycles are not available.

Data on vehicle-kilometres are available from 2010 to 2017.

Data for energy consumption for road, rail and water transport for the year 2018 are not available.

Data for energy consumption and activity of passenger ships and freight airplanes (passenger-kilometres and tonne-kilometres, respectively) are not available. Data for energy consumption for these two transport segments might be partially included under freight ships and passenger airplanes, respectively.

Portugal

Sources
Direcção Geral de Energia e Geologia.

Years covered
General notes
Some transport energy consumption may be included under industry and services.

Residential sector
There is a break in series of biofuels and waste in 2010, due to the results from a household energy consumption survey.

Data for oil & oil products, natural gas and electricity of space heating up to the year 2013 are based on IEA secretariat estimates.

Data for biofuels and waste from 2005 to 2009 and natural gas for the year 2008 for water heating are based on IEA secretariat estimates.

Data for electricity consumption for cooking and lighting up to the year 2009 are based on IEA Secretariat estimates.

Energy intensities for cooking are significantly higher than those for other IEA member countries. This may be explained by the fact that several appliances used for cooking purposes are accounted under “cooking” instead of “other appliances”. A new survey is expected in the future, which may help understanding this aspect.

Data for energy consumption of residential appliances disaggregated by appliance type are available from 2010 onwards.

Data for stocks of refrigerators and PCs are only available for years 2010-2012.

Industry and services sectors
There may be some breaks for the year 2012 for some sub-sectors (e.g. for non-metallic minerals) in energy consumption data from biofuels and waste, due to a more recent industry survey.

Data on services floor area are available for the years 2005-2011.

Data on electricity from 2005 to 2018, natural gas from 2015 to 2016, and heat for the year 2018 for services other building energy use are based on IEA secretariat estimates.

Data for value added for manufacturing subsectors and for services for the year 2018 are not available.

Transport sector
Data for passenger-kilometre of passenger cars for the year 2016 are estimated by the IEA Secretariat.

Data for passenger-kilometres of motorcycles are not available. Data for passenger-kilometres of passenger ships are available from 2014 onwards.

Data on vehicle-kilometres for motorcycles, buses and freight trucks are not available for the year 2018.

Data for passenger-kilometres of buses were revised from 2015 to 2016 based on national statistics publication, resulting in a break for the year 2015.

Data for gasoline consumption for freight trucks for the year 2018 are not available.

Data for energy consumption split by passenger and freight for rail transport for the year 2017 are based on IEA Secretariat estimates.

Data for energy consumption of passenger ships and freight airplanes are not available, and may be partially included under freight ships and passenger airplanes, respectively.

Data for the stocks of freight trucks include commercial road transport, although data for tonne-kilometres of freight trucks may exclude commercial road transport.

Years covered

General note
Data for the energy consumption of transport are not available for all modes. Data for this sector are partially obtained from the country energy balance. Still, the share of transport energy use may be underestimated due to missing data.

Residential sector
Data on energy consumption disaggregated by end use and activity for the residential sector are not available for the year 2017.

Data for number of dwellings and residential floor areas for the year 2017 are not available.

Data on energy consumption for space heating include cooking.

Data on energy consumption for space cooling are not available.
Data on energy consumption for other appliances include dish washers, clothes dryers and PCs.

Data on stocks of dish washers, clothes dryers and PCs are not available.

**Industry and services sectors**

Data on energy consumption for rubber [ISIC 22] and other manufacturing [ISIC 31-32] are included under manufacturing not elsewhere specified, while data for value added are reported separately.

Data for services floor area are not available.

Data for value added are based on price levels and PPP of 2010, instead of 2015 as for other countries.

**Transport sector**

Energy consumption and activity data for the transport sector for the year 2017 are not available at the time of this release.

Data for passenger-kilometre of passenger cars for the year 2016 are based on IEA Secretariat estimates.

Data for passenger-kilometre of motorcycles and domestic passenger ships, tonne-kilometre of domestic freight airplanes are not available.

Data for vehicle-kilometres of passenger trains are available between 2011-2014.

Data on loads of freight transport are not available.

The disaggregation of energy consumption in transport is not available for some modes/vehicle types (e.g. freight road transport).

Data on energy consumption of domestic freight ships are available from 2006 onwards.

Energy consumption for domestic passenger airplanes is not available since 2014.

Data for energy consumption of domestic passenger ships, and domestic freight airplanes are not available. These may be partially included under freight ships and passenger airplanes, respectively.

**Spain**

**Sources**

Instituto para la Diversificación y Ahorro de la Energía (IDAE); Odyssee database.

**Years covered**

**Residential sector**

There may be some breaks between 2009 and 2010 for energy consumption of different end uses, due to different data collection methodologies.

Data for energy consumption of residential appliances by appliance type are not available.

Data for stocks of residential appliances are available only up to 2002.

**Industry and services sectors**

Data for energy consumption for rubber [ISIC 22] and other manufacturing are included under non-specified manufacturing, while data for value added are available separately.

Data for value added for manufacture of basic metals [ISIC 24] for the year 2017 are based on IEA Secretariat estimates.

Data for value added for manufacture of coke and refined petroleum products [ISIC 19] are only available up to 2014.

Data for value added are based on price levels and PPP of 2010, instead of 2015 as for other countries.

**Transport sector**

Data for passenger-kilometres for motorcycles are not available.

There is a break for passenger-kilometres for buses in 2017 due to a change in methodology.

Data for tonne-kilometres for domestic freight airplanes are not available.

Data for vehicle-kilometres and stocks of rail, air, and water transport are not available.

Energy consumption data for domestic freight airplanes and domestic passenger ships may be partially included in domestic passenger airplanes and domestic freight ships, respectively.

**Sweden**

**Sources**

Swedish Energy Agency; Odyssee database.
Years covered
2000-2018 (partially).

General note
There may be some discrepancies between the IEA energy efficiency indicators and the IEA energy balances data. Work is ongoing to improve consistency between these two databases.

Residential sector
Data for oil & oil products consumption for space heating from 2005 to 2014 are based on IEA secretariat estimates.
Data for energy consumption for space cooling are not available.
Data for energy consumption for lighting and for residential appliances by appliance type are available until the year 2013.
Data for total energy consumption of residential appliances include lighting since the year 2014.
Data for energy consumption of other appliances include clothes dryers, TVs and PCs. Data for other appliances up to 2015 are based on IEA secretariat estimates.
Data for stocks and diffusion of appliances for freezers, refrigerator/freezer combinations, dish washers, clothes washers and TVs are only available up to 2013. Data for stocks and diffusion of appliances for refrigerators, clothes dryers and PCs are not available.

Industry and services sectors
Data for oil & oil products and biofuel & waste consumption for most of subsectors has been revised since 2005 due to a new data survey.
Data for value added for the year 2018 for manufacturing subsectors and for services are not available.
Data for biofuels & waste from 2015 to 2018 and for oil & oil products and electricity consumption for the year 2018 for other building energy use in services sector are based on IEA secretariat estimates.

Transport sector
Data for energy consumption of both passenger and freight road transport (passenger cars, motorcycles, buses, and trucks) are not available since the year 2015. Energy consumption data for domestic freight airplanes are not available for the whole time series.

Switzerland

Sources
Swiss Federal Office of Energy (SFOE).

Years covered
2000-2018 (partially).

Residential sector
Data for energy consumption for space heating includes ambient heat reported under “other” fuels.
Data on energy consumption for space cooling are not available.
Data on energy consumption for PCs have been revised in this edition of the publication.

Industry and services sectors
Data for energy consumption for agriculture, forestry and fishing [ISIC 01-03] have been revised.
Data for energy consumption for mining and quarrying [ISIC 05-09], wood manufacturing [ISIC 16], rubber and plastic [ISIC 22], and furniture and other manufacturing [ISIC 31-32] are not available, while data for value added are.
Data for energy consumption for machinery [ISIC 25-28] may also include transport equipment [ISIC 29-30], while value added data are available separately. The intensity figures are calculated aggregating value added data for these two subsectors.
Data for value added for manufacturing subsectors and for services for the year 2018 are not available.

Transport sector
Discrepancies in energy consumption data for transport in relation to the IEA energy balances are mostly due to different accounting methodologies (e.g. fuel tourism is excluded in this publication, etc.).
Activity data (passenger and tonne-kilometres) for domestic airplanes and ships are not available.
Data for vehicle-kilometres of passenger airplanes, freight airplanes and freight ships are not available. Data for vehicle-kilometres of passenger ships are available up to 2006.

Activity data (pkm and vkm) for buses for the year 2018 are the same as the previous year, as official values are not published at the time of this release.

Data for energy consumption for passenger cars, motorcycles, buses, freight trucks, passenger trains and freight trains have been revised for the whole data series due to an update of the model used.

Energy consumption data reported under fuel use to be specified may include off-road fuel use (e.g. agriculture, forestry...).

**Turkey**

**Sources**
General Directorate of Energy Affairs (GDEA).

**Years covered**

**Residential sector**
Data for energy consumption for space cooling and for appliances, split by appliance type are not available.

Data for appliances stocks for refrigerator/freezer combinations, clothes dryers, TVs, and PCs are not available.

Data for appliance stocks for refrigerators, freezers, dish washers, and clothes washers have been revised for the year 2017.

Data for residential floor areas are not available.

**Industry and services sectors**
Data for energy consumption for manufacturing of rubber and plastic products [ISIC 22] are available from 2016 onwards.

There is a break in energy consumption for manufacture of non-metallic mineral products [ISIC 23] in 2017. The break is due to the reporting of petroleum coke for the first time this year.

Data for value added are available at the level of ISIC section (Rev. 4). Further data availability for the different manufacturing subsectors may be available in the future.

Data for employment are available from the year 2005 onwards.

Data for services floor area are not available for the whole time series.

Data for energy consumption for the services sector split by end use are not available.

**Transport sector**
Data for passenger-kilometres of passenger cars and buses are available for the year 2000, 2010 and from 2015 to 2018. Data for passenger-kilometres of passenger trains and domestic passenger ships are available from 2014 onwards.

Data for passenger-kilometres of motorcycles and passenger airplanes are not available.

Data for tonne-kilometres of freight trucks are available from 2001 onwards. Data for tonne-kilometres of domestic freight ships and domestic freight airplanes are not available.

Data for vehicle-kilometres of passenger cars, buses, and freight trucks are available for the year 2000, 2010 and from 2015 to 2018. Data for vehicle-kilometres of passenger trains and freight trains are available from 2014 onwards.

Data for vehicle-kilometres of motorcycles, air and water transport are not available.

Data for vehicle stocks of rail, air and water transport are available since the years 2001, 2008 and 2009 onwards, respectively.

Data for energy consumption split by transport mode/vehicle type are not available. Work is ongoing in order to improve data availability by mode/vehicle type for the transport sector.

**United Kingdom**

**Sources**
Department for Business, Energy and Industrial Strategy (BEIS); Odyssee database.

**Years covered**

**General note**
There may be some historical discrepancies between the IEA energy efficiency indicators and the IEA energy balanc-
es data. Ongoing work is allowing continuous improvement of consistency between these two databases.

**Residential sector**

Data for energy consumption for other residential applian-

cess may include space cooling.

Data for energy consumption for lighting up to the year 2005

is based on IEA Secretariat estimates, and has been re-

vised since 2006 the year due to new modelling results.

Data for energy consumption and appliances stocks for

refrigerators, freezers, refrigerator/freezer combinations,

dish washers, clothes washers and PCs have been revised

for the whole time series due to new modelling results.

Data for energy consumption for clothes dryers has been

revised up to 2009 due to new modelling results.

Data for energy consumption for TVs for the years 2017 and

2018 are based on IEA secretariat estimates, while data for

TV stocks are not available for these years.

Data for occupied dwellings for the year 2004 are based on

IEA Secretariat estimates.

**Industry and services sectors**

Data for energy consumption from biofuels and waste split

by industry subsector are available from 2015 onwards.

Data for electricity consumption for mining and quarrying

[ISIC 05-08] for the year 2000 are based on IEA Secretariat

estimates.

Data for energy consumption for manufacture of furniture

and other manufacturing [ISIC 31-32] are available from

2010 onwards.

Data for energy consumption in the services sector split by

end use are available from 2001 onwards.

There are some breaks for energy consumption data of the

services sector for the year 2015, due to the new BEES

survey results.

**Transport sector**

Data for energy consumption and activity (passenger-

kilometres and tonne-kilometres) of passenger ships and

freight airplanes are not available. Their energy consump-
tion might be partially included under freight ships and pas-
senger airplanes data, respectively.

Data for motor gasoline and diesel consumption for pas-
senger cars, motorcycles, buses and freight trucks have

been revised since the year 2015.

Data for energy consumption for freight trains and passen-
ger trains for the year 2018 are based on IEA Secretariat

estimates.

**United States**

**Sources**

United States Energy Information Administration (EIA); for

transport activity data: U.S. Department of Transportation

(DOT).

**Years covered**

**General note**

There may be some discrepancies between the IEA energy

efficiency indicators and the IEA energy balances data. Work

is ongoing to improve consistency between these two
databases.

Data for non-marketed electricity generation from non-

combustible renewable energy is estimated by EIA based

on the average electric power sector fossil-fuels net heat
rate. This portion of delivered electricity is converted based

on the heat content of electricity.

**Residential sector**

Data on appliances stocks between the years covered by

Residential Energy Consumption Surveys (RECS) are

based on IEA Secretariat estimates. Since 2015, these data

for freezers, refrigerator/freezer combinations and clothes

dryers are based on the Annual Energy Outlook 2019 of the

EIA.

Data for energy consumption from natural gas and electrici-
ty before the year 2017 across residential end uses and

appliances stocks have been reviewed by the IEA Secretar-
iat based on the latest data submitted, in order to improve

time series consistency.

Data reported under “other” fuels for clothes dryers refers to

energy consumption from natural gas.

**Industry and services sectors**

Data for energy consumption of some manufacturing sub-
sectors, for some fuels, prior to the year 2012 are based on

IEA Secretariat estimates.

Data for energy consumption for cement production is

available from 2010 onwards.
Data for energy consumption for the services sector show some breaks (e.g. lighting) for the year 2015. This is partially due to methodological changes (the incorporation of data from the 2012 Commercial Buildings Energy Consumption Survey in the new report), and partially reflecting real trends.

Data for energy consumption for the different services categories reported in other fuels include electricity and other fuels (the latter, are in gross calorific values). For this reason, the total energy consumption by services categories is higher than the total energy consumption by end use.

Data for floor areas of services are not available for the years 2001-2007, and the year 2009.

Data for employment and value added are not available for the year 2018.

**Transport sector**

Data for passenger-kilometres of passenger cars include light duty vehicles, short wheel base from the year 2007 onwards, and hence data are not comparable before and after 2007.

Data for vehicle stocks are not available for the year 2018.

Data for energy consumption from LPG for passenger cars prior to the year 2014 are based on IEA Secretariat estimates.

Data for energy consumption for LPG and natural gas for buses show a break for the year 2015, due to updates in the national reporting from this year onwards.

Data for energy consumption for domestic passenger airplanes up to 2015 and for domestic freight airplanes up to 2008 are based on IEA Secretariat estimates.

Data for energy consumption for motorcycles from 2014-2018 are based on IEA secretariat estimates.

Data for energy consumption of domestic passenger ships for 2000-2004 and consumption of domestic freight ships for 2000-2010 are based on IEA Secretariat estimates.
BEYOND IEA MEMBER COUNTRIES

GENERAL NOTES

The notes in this section refer to data for the years 2000 to 2018 (unless otherwise specified) for countries beyond IEA, which have voluntarily partnered with the agency on the development of energy efficiency indicators.

Morocco was included for the first time in the 2018 edition of the publication as the first IEA association country providing sub-sectoral /end-use data. In the 2019 edition another IEA association country, Brazil, was included thanks to a very close collaboration. In the current edition of this database, we are delighted to add data for Chile (an IEA accession country) and Lithuania for the first time.

Thanks to the ongoing collaboration with the IEA under the EU4Energy programme, Armenia, Belarus, Republic of Moldova and Ukraine started being published in the 2018 edition of this report, while Azerbaijan, Georgia and Uzbekistan were included in the 2019 edition. The EU4Energy programme develops energy statistics capacity in Eastern Europe, Caucasus and Central Asia. It is our wish that more countries from the region may follow in the future.

The IEA welcomes this voluntary effort from countries beyond members with a view to strengthen global end-use data availability.

For the countries referred to above, data availability may differ from that of IEA member countries and is expected to expand over time.

Data are obtained from national administrations through direct submission of the energy efficiency indicators questionnaire, as indicated for each country under the sources section.

In case of estimates made by the IEA Secretariat, explanations are provided in the respective country notes.

Brazil

Sources

Empresa de Pesquisa Energética (EPE) and Ministério de Minas e Energia (MME).

Years covered

2000-2018 (partially).

Residential sector

Data for energy consumption split by end use are available from the year 2005 up to 2017.

The Brazilian residential model considers cooking and other appliances together. The split for these two purposes was estimated based on coefficients derived from the useful energy balance. The confidence in these two end uses is not the same as in the remaining ones.

Data for energy consumption and stocks of refrigerators/ freezer combinations, dish washers, clothes dryers, and PCs are not available.

Data for occupied dwellings are available starting in the year 2005. Data for household occupancy are available since the year 2010.

Data for residential floor areas and degree days are not available for the whole time series.

Industry and services sectors

Data for energy consumption for [ISIC 35] are reported in Mining and quarrying [ISIC 05-09].

Data for energy consumption for manufacture of tobacco [ISIC 12], wood and wood products [ISIC 16], rubber and plastics products [ISIC 22], machinery and equipment [ISIC 26-28], and transport equipment [ISIC 29-30] are reported in manufacturing not elsewhere specified.

Data for energy consumption of manufacture of textiles, wearing apparel and leather [ISIC 13-15] only includes textiles [ISIC 13]. ISIC 14-15 are reported under manufacturing not elsewhere specified.

Data for energy consumption of manufacture of chemicals and chemical products [ISIC 20-21] only includes ISIC 20. ISIC 21 is reported under manufacturing not elsewhere specified.

Data for energy consumption of manufacture of glass are not reported under non-metallic minerals [ISIC 23], but under manufacturing not elsewhere specified.

Data for energy consumption of non-ferrous metals [ISIC 2420+2432] also includes manufacture of fabricated metal products [ISIC 25].

Data for energy consumption of manufacturing not elsewhere specified also includes repair of machinery and equipment [ISIC 33], typically reported in services.
Data for energy consumption of construction [ISIC 41-43] are not available.

Data for value added has similar boundaries as those from the data for energy consumption mentioned above, and are based on the year 2010 unlike most other countries that have value added base year as 2015.

Data for non-building energy use in the services sector refers to street lighting and data are available since the year 2004. Before the year 2004, street lighting is reported under other building energy use.

Data for total and services employment are not available for the year 2018, and data on services floor areas are not available for the whole time series.

**Transport sector**

Data for passenger-kilometres, vehicles stocks and energy consumption of passenger cars, SUV and personal light trucks includes light commercial vehicles.

Data for passenger-kilometres and stocks of buses are available since the year 2008.

Data for passenger-kilometres of trains only includes metro and trams.

Data for vehicle-kilometres are only available for trucks (except for the year 2018).

Data for energy consumption of motorcycles are reported together with passenger cars.

Data for ethanol consumption are reported under other fuels under passenger cars, typically reported together with motor gasoline.

Data for energy consumption of domestic passenger airplanes may include freight domestic airplanes.

Data for appliances stocks and unit energy consumption are available only for the year 2018.

**Industry and services sectors**

Data for manufacture of textiles [ISIC 13-15], wood and wood products [ISIC 16], rubber and plastics [ISIC 22], machinery [ISIC 25-28] and transport equipment [ISIC 29-30] are included in manufacturing not elsewhere specified.

Data for energy consumption for manufacture of food [ISIC 10-12] are available from the year 2014 onwards, and for construction [ISIC 41-43] from 2017 onwards.

Data for energy consumption for non-metallic minerals [ISIC 23] includes only cement energy consumption.

Data for value added for several manufacturing subsectors are not available since the year 2013.

Data for energy consumption of the services sector split by end use are not available.

**Transport sector**

Data for transport activity are not available except for vehicle stocks of passenger cars, motorcycles and buses. Stocks of freight road vehicles are available only for the year 2017.

Data for transport energy consumption split by segment/ mode/ vehicle type are not available.

**Lithuania**

**Sources**

Lithuanian Energy Agency, and Odyssee database.

**Years covered**

2000-2018 (partially)

**Residential sector**

Data for energy consumption for space cooling, lighting and residential appliances split by appliance type are not available. Data for lighting may be reported together with other appliances.

Data for stocks of freezers, refrigerator/freezer combinations, clothes washers and TVs are available up to the year 2009. Data for appliances stocks of dish washers are available for the year 2009. Data for appliances stocks of refrigerators, clothes dryers and PCs are not available.
Industry and services sectors
Data for energy consumption for manufacturing of rubber and plastics [ISIC 22] and other manufacturing [ISIC 31-32] are available from 2008 onwards. Data for energy consumption for manufacturing of cement are not available.
Data for value added for the year 2018 are available at the level of the ISIC section (Rev. 4). Data for value added of manufacturing of coke and refined petroleum products [ISIC 19] are not available due to confidentiality reasons.
Data for services floor areas are not available.

Transport sector
Data for passenger-kilometres for passenger cars are not available for the year 2018. Data for passenger-kilometres for motorcycles are not available.
Data for vehicle kilometres for passenger cars, motorcycles, freight trucks, air and water transport are not available.
Data for energy consumption for passenger cars, motorcycles and freight trucks are not available for the year 2018.
Data for energy consumption for domestic passenger airplanes are not available for the years 2017 and 2018.
Data for energy consumption for buses and domestic passenger freight ships are available from 2008 onwards.
Data for energy consumption for domestic passenger ships and domestic freight airplanes are not available.

Morocco

Sources

Years covered

General note
There are some discrepancies between the IEA energy efficiency indicators and the IEA energy balances databases. Work is ongoing to improve data consistency.

Residential sector
Data for energy consumption split by end use are available between the year 2004 and the year 2016.

Data for energy consumption per appliance type are available for refrigerators, clothes washers and TVs. Data for energy consumption for other appliances are not available.
Data for appliances stocks and diffusion are not available. Instead, the publication shows the change in the rate of dwellings equipped with specific appliances types for the time period 2004-2015.
Data on dwellings refers to total dwellings instead of occupied dwellings, and are not available for the year 2017.
Data for residential floor areas are available only for the year 2012.
Data for heating and cooling degree days are not available.

Industry and services sectors
Data for energy consumption for manufacturing of rubber and plastic products [ISIC 22] are included under Manufacturing not elsewhere specified.
Data for value added are available between the year 2007 and the year 2017 and are based on price levels and PPP of 2010, instead of 2015 as for other countries. Data for value added are not available for several manufacturing subsectors.
Non-Building Energy use in the service sector refers to street lighting.

Transport sector
Data for passenger-kilometres and tonne-kilometres are available for rail only from the year 2004 until 2015. These have been estimated by the IEA Secretariat based on country submission.
Data for occupancy and loads of road transport are not available.
Data for vehicle stocks and vehicle-kilometres are based on country estimates, and are available between the year 2008 and 2016.
Data for vehicle stocks of passenger cars may include buses.
Data for energy consumption of passenger cars and freight road transport are based on country estimates, and are available between the years 2008 and 2016. Data for energy consumption of passenger cars also include motorcycles and buses.
Data for energy consumption of domestic passenger airplanes may also include domestic freight airplanes.
Data for energy consumption of rail transport split between passenger and freight rail are not available. Data for energy
consumption of domestic water transport are also not available.

**Armenia**

**Sources**
Statistical Committee of the Republic of Armenia, Yerevan.

**Years covered**

**General note**
Sub-sectoral data are only available for the industry sector.

**Industry and services sectors**
Data split by industry subsector for oil products, natural gas and biofuels and waste consumption in the industry sector are reported from the year 2014 onwards. This leads to breaks in the time series for total final energy consumption of several industry subsectors.

Data for coal and heat consumption in the industry sector are not available.

Partial energy consumption data availability (by fuel) may lead to relatively low energy intensities. Work is ongoing to improve data availability across industry subsectors.

Data for value added are available from 2012 onwards and are based on price levels and PPP of 2010, instead of 2015 as for other countries. The conversion of these data into 2010 USD PPP was made by IEA Secretariat, based on country submission.

**Belarus**

**Sources**
National Statistical Committee of the Republic of Belarus.

**Years covered**

**Residential sector**
Data for energy consumption disaggregated by end use are not available.

Data for appliances stocks are available from the year 2001 onwards.

**Industry and services sectors**
Data for energy consumption for manufacturing of rubber and plastic products [ISIC 22] are included under Manufacturing not elsewhere specified.

Data for value added are available from 2010 onwards and are based on price levels and PPP of 2010, instead of 2015 as for other countries. The conversion of these data into 2010 USD PPP was made by IEA Secretariat, based on country submission.

**Azerbaijan**

**Sources**

**Years covered**

**General note**
Sub-sectoral data are only available for the industry sector.

**Residential sector**
Data for energy consumption disaggregated by end use are not available.

Data for appliances stocks are available from the year 2001 onwards.

**Industry and services sectors**
Data for energy consumption for manufacturing of rubber and plastic products [ISIC 22] are included under Manufacturing not elsewhere specified.

Data for value added are available from 2010 onwards and are based on price levels and PPP of 2010, instead of 2015 as for other countries. The conversion of these data into 2010 USD PPP was made by IEA Secretariat, based on country submission.
Transport sector
Data for transport energy consumption split by segment/ mode/ vehicle type are not available, except for passenger buses and freight road transport.
Data for passenger-kilometres of passenger cars and motorcycles are not available. Data for vehicle-kilometres are not available.

Georgia

Sources
National Statistics Office of Georgia – GEOSTAT.

Years covered

Residential sector
Data for energy consumption disaggregated by end use are available from 2016 onwards.
Data for energy consumption for split by appliance type are not available. Energy consumption data for lighting are reported under other appliances.
Data for appliances stocks and degree days are not available.
Data for number of dwellings, residential floor areas and household occupancy are available only for the year 2014.

Industry and services sectors
Data for the split of energy consumption for paper [ISIC 17] and printing [ISIC 18], and for the manufacture of rubber and plastic [ISIC 22] and Electricity, gas, steam, air conditioning and water supply [ISIC 35-36] are available from the year 2013 onwards.
Data for energy consumption for manufacture of coke and refined petroleum products [ISIC 19] are available from the year 2015 onwards.
Data for the energy consumption for manufacturing of basic metals [ISIC 24] split by ferrous and non-ferrous metals are not available.
Data on value added are available at the level of ISIC section (Rev. 4).
Data for value added for Georgia and are based on price levels and PPP of 2010, instead of 2015 as for other countries. The PPP adjustment was done by the IEA Secretariat, based on country submission.

Transport sector
Data split by segment mode/ vehicle type for the transport sector are not available.

Republic of Moldova

Sources

Years covered

General note
The data presented does not include the districts from the left side of the river Nistru and municipality Bender.

Residential sector
Data for energy consumption from biofuels and waste shows a break for the year 2010, which is also affecting the time series for total energy consumption of this sector. This may be due to different data collection methodologies, and work is ongoing to improve consistency of the time series.
Energy consumption data split by end use are available from the year 2015 onwards.
Data for energy consumption for lighting are included under residential appliances. Data for appliances stocks are available from the year 2010 onwards.
Data for energy consumption of residential appliances by appliance type are not available.
Data for occupied dwellings are not available. Hence, energy intensities per dwelling are calculated using total number of dwellings instead of occupied dwellings. Similarly, appliances diffusion refers to total number of dwellings.
Data for heating and cooling degree days are not available.

Industry and services sectors
Data for energy consumption from renewables are available from 2005 onwards.
Data for energy consumption for manufacturing of rubber and plastic products [ISIC 22] are available from 2015 onwards.

Data on value added are available at the level of ISIC section (Rev. 4), from the year 2010 onwards and are based on price levels and PPP of 2010, instead of 2015 as for other countries. The adjustment of these data for PPP is made by IEA Secretariat, based on country submission.

Transport sector
Data split by segment mode/ vehicle type for the transport sector are not available.

Ukraine

Sources
State Statistics Service of Ukraine.

Years covered

General notes
Due to limited information available to the State Statistics Service of Ukraine from the Donetsk and Luhansk regions of Ukraine and from the Autonomous Republic of Crimea, breaks in the time series occur after the year 2013.

Residential sector
Data for energy consumption split by end use are available from the year 2016 onwards.

Data for energy consumption of residential appliances include lighting, and data for energy consumption of residential appliances by appliance type are not available.

Data for degree days and occupied dwellings are not available. Hence, energy intensities per dwelling are calculated using total number of dwellings instead of occupied dwellings. Similarly, appliances diffusion refers to total number of dwellings.

Industry and services sectors
Data for energy consumption for manufacturing of rubber and plastic products [ISIC 22] are included under Manufacturing not elsewhere specified.

Data for value added by manufacturing subsector are available since the year 2012 onwards and are based on price levels and PPP of 2010, instead of 2015 as for other countries. The adjustment of these data for PPP is made by the IEA Secretariat, based on country submission.

Uzbekistan

Sources
State Committee of the Republic of Uzbekistan on Statistics.

Years covered

General notes
Sub-sectoral data are only available for the industry sector.

Industry and services sectors
There are discrepancies between the IEA energy efficiency indicators and the IEA energy balances data. Work is ongoing to improve consistency between these two databases.

Data split by industry subsector are available from the year 2014 onwards.

Data for value added are available from 2010 until 2016 and are based on price levels and PPP of 2010, instead of 2015 as for other countries. The conversion of these data into 2010 USD PPP is made by IEA Secretariat, based on country submission.
